

## **Combine Buddhist system learning and Reinforcement learning to improve the learning of agents**

Reinforcement learning (RL) is an area of machine learning inspired by psychology of behavior, concerned with how software agents ought to take actions in an environment so as to maximize some notion of cumulative reward.

Buddhist system learning (BSL) is a learning method by using the willpower of man and the according knowledge of Buddhist system. This method is recently proposed. And the relevant knowledge of Buddhist system is full of wisdom of ancestors. Now the methods which are art of state include all let it be(ALIB). For example, put the subjects you want to study in front of your eyes, If you have a chance with it, it will review itself.

In the paper, we proposed a method to Combine Buddhist system learning and Reinforcement learning in order to improve the learning efficiency of agents.
